Today Finish Euclid. Bijection/CRT/Isomorphism. Fermat's Little Theorem. 1/33	Greatest Common Divisor and Inverses.Thm:If greatest common divisor of x and m, $gcd(x, m)$, is 1, then x has a multiplicative inverse modulo m.Proof \Rightarrow :Claim: The set $S = \{0x, 1x, \dots, (m-1)x\}$ contains $y \equiv 1 \mod m$ if all distinct modulo m.Each of m numbers in S correspond to one of m equivalence classes modulo m. \Rightarrow One must correspond to 1 modulo m. Inverse Exists!Proof of Claim: If not distinct, then $\exists a, b \in \{0, \dots, m-1\}, a \neq b$, where $(ax \equiv bx \pmod{m}) \Rightarrow (a-b)x \equiv 0 \pmod{m}$ Or $(a-b)x = km$ for some integer k. $gcd(x,m) = 1$ \Rightarrow Prime factorization of m and x do not contain common primes. $\Rightarrow (a-b)$ has to be multiple of m. $\Rightarrow (a-b) \ge m$. But $a, b \in \{0, \dots, m-1\}$. Contradiction.	Proof review. Consequence.Thm: If $gcd(x,m) = 1$, then x has a multiplicative inverse modulo m.Proof Sketch: The set $S = \{0x, 1x,, (m-1)x\}$ contains $y \equiv 1 \mod m$ if all distinct modulo mFor $x = 4$ and $m = 6$. All products of 4 $S = \{0(4), 1(4), 2(4), 3(4), 4(4), 5(4)\} = \{0, 4, 8, 12, 16, 20\}$ reducing (mod 6) $S = \{0, 4, 2, 0, 4, 2\}$ Not distinct. Common factor 2. Can't be 1. No inverse.For $x = 5$ and $m = 6$. $S = \{0(5), 1(5), 2(5), 3(5), 4(5), 5(5)\} = \{0, 5, 4, 3, 2, 1\}$ All distinct, contains 1! 5 is multiplicative inverse of 5 (mod 6).(Hmm. What normal number is it own multiplicative inverse?) 1 -1. $5x = 3 \pmod{6}$ $x = 15 = 3 \pmod{6}$ $4x = 3 \pmod{6}$ No solutions. Can't get an odd. $4x = 2 \pmod{6}$ Two solutions! $x = 2,5 \pmod{6}$ Very different for elements with inverses.
Proof Review 2: Bijections. If $gcd(x,m) = 1$. Then the function $f(a) = xa \mod m$ is a bijection. One to one: there is a unique pre-image. Onto: the sizes of the domain and co-domain are the same. x = 3, m = 4. $f(1) = 3(1) = 3 \pmod{4}, f(2) = 6 = 2 \pmod{4}, f(3) = 1 \pmod{3}$. Oh yeah. $f(0) = 0$. Bijection = unique pre-image and same size. All the images are distinct. \implies unique pre-image for any image. x = 2, m = 4. f(1) = 2, f(2) = 0, f(3) = 2 Oh yeah. $f(0) = 0$. Not a bijection.	Poll Which is bijection? (A) $f(x) = x$ for domain and range being \mathbb{R} (B) $f(x) = ax \pmod{(n)}$ for $x \in \{0,, n-1\}$ and $gcd(a, n) = 2$ (C) $f(x) = ax \pmod{n}$ for $x \in \{0,, n-1\}$ and $gcd(a, n) = 1$ (B) is not.	Only if Thm: If $gcd(x,m) \neq 1$ then x has no multiplicative inverse modulo m. Assume a is x^{-1} , or $ax = 1 + km$. $x = nd$ and $m = \ell d$ for $d > 1$. Thus, $a(nd) = 1 + k\ell d$ or $d(na - k\ell) = 1$. But $d > 1$ and $n = (na - k\ell) \in \mathbb{Z}$. so $dn \neq 1$ and $dn = 1$. Contradiction.

Finding inverses.

How to find the inverse?
How to find if *x* has an inverse modulo *m*?
Find gcd (*x*, *m*).
Greater than 1? No multiplicative inverse.
Equal to 1? Mutliplicative inverse.
Algorithm: Try all numbers up to *x* to see if it divides both *x* and *m*.
Very slow.

Excursion: Value and Size.

Before discussing running time of gcd procedure... What is the value of 1,000,000? one million or 1,000,000! What is the "size" of 1,000,000? Number of digits in base 10: 7. Number of bits (a digit in base 2): 21. For a number *x*, what is its size in bits?

 $n = b(x) \approx \log_2 x$

More divisibility

```
Notation: d|x means "d divides x" or
      x = kd for some integer k.
Lemma 1: If d|x and d|y then d|y and d| \mod (x, y).
Proof:
  mod(x,y) = x - |x/y| \cdot y
              = x - [s] \cdot y for integer s
              = kd - s\ell d for integers k, \ell where x = kd and y = \ell d
              = (k - s\ell)d
Therefore d \mod (x, y). And d \mid y since it is in condition.
                                                                  Lemma 2: If d|y and d| \mod (x, y) then d|y and d|x.
Proof...: Similar. Try this at home.
                                                               □ish.
GCD Mod Corollary: gcd(x, y) = gcd(y, mod(x, y)).
Proof: x and y have same set of common divisors as x and
mod(x, y) by Lemma 1 and 2.
Same common divisors \implies largest is the same.
```

Euclid procedure is fast.

7/33

10/33

Theorem: (euclid x y) uses 2*n* "divisions" where $n = b(x) \approx \log_2 x$. Is this good? Better than trying all numbers in $\{2, \dots y/2\}$? Check 2, check 3, check 4, check 5 ..., check y/2. If $y \approx x$ roughly y uses *n* bits ... 2^{n-1} divisions! Exponential dependence on size! 101 bit number. $2^{100} \approx 10^{30} =$ "million, trillion, trillion" divisions! 2n is much faster! ... roughly 200 divisions.

Euclid's algorithm.

GCD Mod Corollary: gcd(x, y) = gcd(y, mod(x, y)). Hey, what's gcd(7,0)? 7 since 7 divides 7 and 7 divides 0 What's gcd(x,0)? x (define (euclid x y) (if (= y 0) x (euclid y (mod x y)))) *** **Theorem:** (euclid x y) = gcd(x, y) if $x \ge y$. Proof: Use Strong Induction. **Base Case:** y = 0, "x divides y and x" \implies "x is common divisor and clearly largest." **Induction Step:** mod $(x, y) < y \le x$ when $x \ge y$ call in line (***) meets conditions plus arguments "smaller" and by strong induction hypothesis computes gcd(y, mod(x, y))which is gcd(x, y) by GCD Mod Corollary. Poll.

Assume $\log_2 1,000,000$ is 20 to the nearest integer. Mark what's true.

(A) The size of 1,000,000 is 20 bits.
(B) The size of 1,000,000 is one million.
(C) The value of 1,000,000 is one million.
(D) The value of 1,000,000 is 20.

(A) and (C).

Poll	Algorithms at work.	Runtime Proof.
Which are correct? (A) gcd(700,568) = gcd (568,132) (B) gcd(8,3) = gcd(3,2) (C) gcd(8,3) = 1 (D) gcd(4,0) = 4	Trying everything Check 2, check 3, check 4, check 5, check y/2. "(gcd x y)" at work. euclid(700,568) euclid(568, 132) euclid(132, 40) euclid(12, 4) euclid(12, 4) euclid(4, 0) 4 Notice: The first argument decreases rapidly. At least a factor of 2 in two recursive calls. (The second is less than the first.)	(define (euclid x y) (if (= y 0) x (euclid y (mod x y)))) Theorem: (euclid y (mod x y)))) Theorem: (euclid x y) uses $O(n)$ "divisions" where $n = b(x)$. Proof: Fact: First arg decreases by at least factor of two in two recursive calls. After $2\log_2 x = O(n)$ recursive calls, argument x is 1 bit number. One more recursive call to finish. 1 division per recursive call. O(n) divisions.
Runtime Proof (continued.)	Poll	14/33 15/33 Finding an inverse?
(define (euclid x y) (if (= y 0) x (euclid y (mod x y)))) Fact: First arg decreases by at least factor of two in two recursive calls. Proof of Fact: Recall that first argument decreases every call. Case 1: $y < x/2$, first argument is y \Rightarrow true in one recursive call; Case 2: Will show " $y \ge x/2$ " \Rightarrow "mod $(x, y) \le x/2$." mod (x, y) is second argument in next recursive call, and becomes the first argument in the next one. When $y \ge x/2$, then $\lfloor \frac{x}{y} \rfloor = 1$, mod $(x, y) = x - y \lfloor \frac{x}{y} \rfloor = x - y \le x - x/2 = x/2$	Mark correct answers. Note: Mod(x,y) is the remainder of x divided by y. (A) mod $(x, y) < y$ (B) If euclid(x,y) calls euclid(u,v) calls euclid (a,b) then $a <= x/2$. (C) euclid(x,y) calls euclid (u,v) means $u = y$. (D) if $y > x/2$, $mod(x, y) < y/2$ (E) if $y > x/2$, $mod(x, y) = (y - x)$ (D) is not always true.	We showed how to efficiently tell if there is an inverse. Extend euclid to find inverse.

Euclid's GCD algorithm.	Multiplicative Inverse.	Extended GCD
(define (euclid x y) (if (= y 0) x (euclid y (mod x y)))) Computes the $gcd(x, y)$ in $O(n)$ divisions. (Remember $n = \log_2 x$.) For x and m, if $gcd(x, m) = 1$ then x has an inverse modulo m.	GCD algorithm used to tell if there is a multiplicative inverse. How do we find a multiplicative inverse?	Excented COD Euclid's Extended GCD Theorem: For any <i>x</i> , <i>y</i> there are integers <i>a</i> , <i>b</i> such that ax + by = d where $d = gcd(x, y)$. "Make <i>d</i> out of sum of multiples of <i>x</i> and <i>y</i> ." What is multiplicative inverse of <i>x</i> modulo <i>m</i> ? By extended GCD theorem, when $gcd(x,m) = 1$. ax + bm = 1 $ax \equiv 1 - bm \equiv 1 \pmod{m}$. So <i>a</i> multiplicative inverse of <i>x</i> (mod <i>m</i>)!! Example: For <i>x</i> = 12 and <i>y</i> = 35, $gcd(12,35) = 1$. (3)12+(-1)35 = 1. <i>a</i> = 3 and <i>b</i> = -1. The multiplicative inverse of 12 (mod 35) is 3. Check: 3(12) = 36 = 1 (mod 35).
19/33	20/33	21/33
Make <i>d</i> out of multiples of <i>x</i> and <i>y</i> ?	Extended GCD Algorithm.	Extended GCD Algorithm.
gcd (35, 12) $gcd (12, 11) ;; gcd (12, 35%12)$ $gcd (11, 1) ;; gcd (11, 12%11)$ $gcd (1, 0)$ 1 How did gcd get 11 from 35 and 12? $35 - \lfloor \frac{35}{12} \rfloor 12 = 35 - (2)12 = 11$ How does gcd get 1 from 12 and 11? $12 - \lfloor \frac{12}{11} \rfloor 11 = 12 - (1)11 = 1$ Algorithm finally returns 1. But we want 1 from sum of multiples of 35 and 12? Get 1 from 12 and 11. 1 = 12 - (1)11 = 12 - (1)(35 - (2)12) = (3)12 + (-1)35 Get 11 from 35 and 12 and plugin Simplify. $a = 3$ and $b = -1$.	<pre>ext-gcd(x,y) if y = 0 then return(x, 1, 0) else (d, a, b) := ext-gcd(y, mod(x,y)) return (d, b, a - floor(x/y) * b) Claim: Returns (d,a,b): d = gcd(a,b) and d = ax + by. Example: a - [x/y] · b = 1 - 011 / 1230 / 1211 · (-1) = 3 ext-gcd(35,12) ext-gcd(12, 11) ext-gcd(11, 1) ext-gcd(1, 0) return (1,0) ;; 1 = (1)1 + (0) 0 return (1,0) ;; 1 = (0)11 + (1)1 return (1,1-1) ;; 1 = (1)12 + (-1)11 return (1,-1, 3) ;; 1 = (-1)35 + (3)12 </pre>	<pre>ext-gcd(x,y) if y = 0 then return(x, 1, 0) else (d, a, b) := ext-gcd(y, mod(x,y)) return (d, b, a - floor(x/y) * b) Theorem: Returns (d,a,b), where d = gcd(a,b) and d = ax + by.</pre>

Correctness.	Review Proof: step.		Hand Calculation Method for Inverses.	
Proof: Strong Induction. ¹ Base: ext-gcd(x,0) returns (d = x,1,0) with x = (1)x + (0)y. Induction Step: Returns (d, A, B) with d = Ax + By Ind hyp: ext-gcd(y, mod (x,y)) returns (d, a, b) with d = ay + b(mod (x,y)) ext-gcd(x,y) calls ext-gcd(y, mod (x,y)) so d = ay + b \cdot (mod (x,y)) = ay + b \cdot (x - \lfloor \frac{x}{y} \rfloor y) = bx + (a - \lfloor \frac{x}{y} \rfloor \cdot b)y And ext-gcd returns (d, b, $(a - \lfloor \frac{x}{y} \rfloor \cdot b))$ so theorem holds!	ext-gcd(x,y) if y = 0 then return(x, 1, 0) else (d, a, b) := ext-gcd(y, mod(x,y)) return (d, b, a - floor(x/y) * b) Recursively: $d = ay + b(x - \lfloor \frac{x}{y} \rfloor \cdot y) \implies d = bx - (a - \lfloor \frac{x}{y} \rfloor b)y$ Returns $(d, b, (a - \lfloor \frac{x}{y} \rfloor \cdot b))$.		Example: $gcd(7, 60) = 1$. gcd(7, 60). 7(0) + 60(1) = 60 7(1) + 60(0) = 7 7(-8) + 60(1) = 4 7(9) + 60(-1) = 3 7(-17) + 60(2) = 1 Confirm: $-119 + 120 = 1$ Note: an "iterative" version of the e-gcd algorithm.	
¹ Assume <i>d</i> is $gcd(x, y)$ by previous proof. 25/33 Wrap-up	Bijections	26/33	Lots of Mods	27/33
Conclusion: Can find multiplicative inverses in $O(n)$ time! Very different from elementary school: try 1, try 2, try 3 $2^{n/2}$ Inverse of 500,000,357 modulo 1,000,000,000,000? \leq 80 divisions. versus 1,000,000 Internet Security. Public Key Cryptography: 512 digits. 512 divisions vs. (1000000000000000000000000000000000000	Bijection is one to one and onto. Bijection: $f: A \rightarrow B$. Domain: A , Co-Domain: B . Versus Range. E.g. sin (x). A = B = reals. Range is [-1,1]. Onto: [-1,1]. Not one-to-one. sin (π) = sin (0) = 0. Range Definition always is onto. Consider $f(x) = ax \mod m$. $f: \{0,, m-1\} \rightarrow \{0,, m-1\}$. Domain/Co-Domain: $\{0,, m-1\}$. When is it a bijection? When $gcd(a, m)$ is? 1. Not Example: $a = 2, m = 4, f(0) = f(2) = 0 \pmod{4}$.		$x = 5 \pmod{7}$ and $x = 3 \pmod{5}$. What is $x \pmod{35}$? Let's try 5. Not 3 (mod 5)! Let's try 3. Not 5 (mod 7)! If $x = 5 \pmod{7}$ then x is in {5,12,19,26,33}. Oh, only 33 is 3 (mod 5). Hmmm only one solution. A bit slow for large values.	
28/33		29/33		30/3

Fermat and Exponent reducing. Lecture in a minute. **Fermat's Little Theorem:** For prime p, and $a \neq 0 \pmod{p}$, $a^{p-1} \equiv 1 \pmod{p}$. What is 2¹⁰¹ (mod 7)? Wrong: $2^{101} = 2^{7*14+3} = 2^3 \pmod{7}$ Fermat: 2 is relatively prime to 7. $\implies 2^6 = 1 \pmod{7}$. Correct: $2^{101} = 2^{6*16+5} = 2^5 = 32 = 4 \pmod{7}$. For a prime modulus, we can reduce exponents modulo p-1!

37/33

Euclid's Alg: $gcd(x,y) = gcd(y,x \mod y)$ Fast cuz value drops by a factor of two every two recursive calls.

Extended Euclid: Find *a*, *b* where ax + by = gcd(x, y). Idea: compute *a*, *b* recursively (euclid), or iteratively. Inverse: $ax + by = ax = gcd(x, y) \mod y$. If gcd(x,y) = 1, we have $ax = 1 \mod y$ $\rightarrow a = x^{-1} mody.$

Chinese Remainder Theorem:

```
If gcd(n,m) = 1, x = a \pmod{n}, x = b \pmod{m} unique sol.
```

Proof: Find $u = 1 \pmod{n}$, $u = 0 \pmod{m}$, and $v = 0 \pmod{n}$, $v = 1 \pmod{m}$. Then: $x = au + bv = a \pmod{n}$... $u = m(m^{-1} \pmod{n}) \pmod{n}$ works!

Fermat: Prime p, $a^{p-1} = 1 \pmod{p}$. Proof Idea: $f(x) = a(x) \pmod{p}$: bijection on $S = \{1, ..., p-1\}$. Product of elts == for range/domain: a^{p-1} factor in range.

38/33
