

# Calculus Review

$$\frac{d(e^{cx})}{dx} = ce^{cx}.$$

$$\frac{d(x^2)}{dx} = 2x.$$

$$\int x dx = \frac{x^2}{2} + c.$$

$$\frac{d(\ln x)}{dx} = \frac{1}{x}$$

Chain Rule:  $\frac{d(f(g(x)))}{dx} = f'(g(x))g'(x)dx$

Product Rule:

$$(f(x)g(x))' = f'(x)g(x) + f(x)g'(x).$$

$$d(uv) = u dv + v du$$

Integration by Parts:  $\int u dv = uv - \int v du.$

# Summary

## Continuous Probability 1

1. pdf:  $Pr[X \in (x, x + \delta)] \approx f_X(x)\delta$ .
2. CDF:  $Pr[X \leq x] = F_X(x) = \lim_{\delta \rightarrow 0} \sum_i f_X(x_i)\delta = \int_{-\infty}^x f_X(y)dy$ .
3.  $X \sim U[a, b]$ :  $f_X(x) = \frac{1}{b-a} \mathbf{1}\{a \leq x \leq b\}$ ;  $F_X(x) = \frac{x-a}{b-a}$  for  $a \leq x \leq b$ .
4.  $X \sim \text{Expo}(\lambda)$ :  
 $f_X(x) = \lambda \exp\{-\lambda x\} \mathbf{1}\{x \geq 0\}$ ;  $F_X(x) = 1 - \exp\{-\lambda x\}$  for  $x \geq 0$ .
5. Target:  $f_X(x) = 2x \cdot \mathbf{1}\{0 \leq x \leq 1\}$ ;  $F_X(x) = x^2$  for  $0 \leq x \leq 1$ .
6. Joint pdf:  $Pr[X \in (x, x + \delta), Y \in (y, y + \delta)] = f_{X,Y}(x, y)\delta^2$ .
  - 6.1 Conditional Distribution:  $f_{X|Y}(x, y) = \frac{f_{X,Y}(x, y)}{f_Y(y)}$ .
  - 6.2 Independence:  $f_{X|Y}(x, y) = f_X(x)$

# Poll

What is true?

$X$  has CDF  $F(x)$  and PDF  $f(x)$ .

(A)  $Pr[X > t] = 1 - Pr[X \leq t]$ .

(B)  $S(t) = Pr[X > t] = 1 - F(t)$ .

(C)  $Y = 2X, f_Y(y) = 2f(y)$ .

(D)  $Y = 2X, F_Y(y) = F(y/2)$ .

(E)  $Y = 2X, f_Y(y) = \frac{1}{2}f(y/2)$ .

(A), (B), (D) think events, (E) think event and density.

(C) confuses probability density of outcome with value of outcome.

# Discrete/Continuous

Discrete: Probability of outcome  $\rightarrow$  random variables, events.

Continuous: “outcome” is real number.

Probability: Events is interval.

Density:  $Pr[X \in [x, x + dx]] = f(x)dx$

Joint Continuous in  $d$  variables: “outcome” is  $\in R^d$ .

Probability: Events is block.

Density:  $Pr[(X, Y) \in ([x, x + dx], [y, y + dy])] = f(x, y)dxdy$

# Probability

Probability!

Challenges us. But really neat.

At times, continuous. At others, discrete.

Sample Space:  $\Omega$ ,  $Pr[\omega]$ .

Event:  $Pr[A] = \sum_{\omega \in A} Pr[\omega]$

$\sum_{\omega} Pr[\omega] = 1$ .

Random variables:  $X(\omega)$ .

Distribution:  $Pr[X = x]$

$\sum_x Pr[X = x] = 1$ .

Random Variable:  $X$

Event:  $A = [a, b]$ ,  $Pr[X \in A]$ ,

CDF:  $F(x) = Pr[X \leq x]$ .

PDF:  $f(x) = \frac{dF(x)}{dx}$ .

$\int_{-\infty}^{\infty} f(x) = 1$ .

Continuous as Discrete.

$Pr[X \in [x, x + \delta]] \approx f(x)\delta$

# Probability Rules are all good.

Conditional Probability.

Events:  $A, B$

Discrete: “Heads”, “Tails”,  $X = 1, Y = 5$ .

Continuous:  $X$  in  $[.2, .3]$ .  $X \in [.2, .3]$  or  $X \in [.4, .6]$ .

Conditional Probability:  $Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]}$

$Pr$ [“Second Heads”|“First Heads”],  
 $Pr[X \in [.2, .3]|X \in [.2, .3]$  or  $X \in [.5, .6]]$ .

Total Probability Rule:  $Pr[A] = Pr[A \cap B] + Pr[A \cap \bar{B}]$

$Pr$ [“Second Heads”] =  $Pr[HH] + Pr[HT]$   
 $B$  is First coin heads.

$Pr[X \in [.45, .55]] = Pr[X \in [.45, .50]] + Pr[X \in (.50, .55]]$   
 $B$  is  $X \in [0, .5]$

Product Rule:  $Pr[A \cap B] = Pr[A|B]Pr[B]$ .

Bayes Rule:  $Pr[A|B] = Pr[B|A]Pr[A]/Pr[B]$ .

All work for continuous with intervals as events.

## Conditional density.

Conditional Density:  $f_{X|Y}(x, y)$ .

Conditional Probability:  $Pr[X \in A | Y \in B] = \frac{Pr[X \in A, Y \in B]}{Pr[Y \in B]}$

$$Pr[X \in [x, x + dx] | Y \in [y, y + dy]] = \frac{f_{X,Y}(x,y) dx dy}{f_Y(y) dy}$$

$$f_{X|Y}(x, y) = \frac{f_{X,Y}(x,y)}{f_Y(y)} = \frac{f_{X,Y}(x,y)}{\int_{-\infty}^{+\infty} f_{X,Y}(x,y) dx}$$

Corollary: For independent random variables,  $f_{X|Y}(x, y) = f_X(x)$ .

## Expo( $\lambda$ )

The exponential distribution with parameter  $\lambda > 0$  is defined by

$$f_X(x) = \lambda e^{-\lambda x} 1_{\{x \geq 0\}}$$

$$F_X(x) = \begin{cases} 0, & \text{if } x < 0 \\ 1 - e^{-\lambda x}, & \text{if } x \geq 0. \end{cases}$$

Note that  $Pr[X > t] = e^{-\lambda t}$  for  $t > 0$ .

# Some Properties

1. **Expo is memoryless.** Let  $X = \text{Expo}(\lambda)$ . Then, for  $s, t > 0$ ,

$$\begin{aligned} \Pr[X > t + s \mid X > s] &= \frac{\Pr[X > t + s]}{\Pr[X > s]} \\ &= \frac{e^{-\lambda(t+s)}}{e^{-\lambda s}} = e^{-\lambda t} \\ &= \Pr[X > t]. \end{aligned}$$

'Used is as good as new.'

2. **Scaling Expo.** Let  $X = \text{Expo}(\lambda)$  and  $Y = aX$  for some  $a > 0$ . Then

$$\begin{aligned} \Pr[Y > t] &= \Pr[aX > t] = \Pr[X > t/a] \\ &= e^{-\lambda(t/a)} = e^{-(\lambda/a)t} = \Pr[Z > t] \text{ for } Z = \text{Expo}(\lambda/a). \end{aligned}$$

Thus,  $a \times \text{Expo}(\lambda) = \text{Expo}(\lambda/a)$ .

Also,  $\text{Expo}(\lambda) = \frac{1}{\lambda} \text{Expo}(1)$ .

## More Properties

**3. Scaling Uniform.** Let  $X = U[0, 1]$  and  $Y = a + bX$  where  $b > 0$ .

Then,

$$\begin{aligned}Pr[Y \in (y, y + \delta)] &= Pr[a + bX \in (y, y + \delta)] = Pr[X \in (\frac{y - a}{b}, \frac{y + \delta - a}{b})] \\&= Pr[X \in (\frac{y - a}{b}, \frac{y - a}{b} + \frac{\delta}{b})] = \frac{1}{b}\delta, \text{ for } 0 < \frac{y - a}{b} < 1 \\&= \frac{1}{b}\delta, \text{ for } a < y < a + b.\end{aligned}$$

Thus,  $f_Y(y) = \frac{1}{b}$  for  $a < y < a + b$ . Hence,  $Y = U[a, a + b]$ .

Replace  $b$  by  $b - a$ , use  $X = U[0, 1]$ , then  $Y = a + (b - a)X$  is  $U[a, b]$ .

## Some More Properties

**4. Scaling pdf.** Let  $f_X(x)$  be the pdf of  $X$  and  $Y = a + bX$  where  $b > 0$ . Then

$$\begin{aligned}Pr[Y \in (y, y + \delta)] &= Pr[a + bX \in (y, y + \delta)] = Pr[X \in (\frac{y-a}{b}, \frac{y+\delta-a}{b})] \\ &= Pr[X \in (\frac{y-a}{b}, \frac{y-a}{b} + \frac{\delta}{b})] = f_X(\frac{y-a}{b}) \frac{\delta}{b}.\end{aligned}$$

Now, the left-hand side is  $f_Y(y)\delta$ . Hence,

$$f_Y(y) = \frac{1}{b} f_X(\frac{y-a}{b}).$$

# Expectation

**Definition:** The **expectation** of a random variable  $X$  with pdf  $f(x)$  is defined as

$$E[X] = \int_{-\infty}^{\infty} xf_X(x)dx.$$

**Justification:** Say  $X = n\delta$  w.p.  $f_X(n\delta)\delta$  for  $n \in \mathbb{Z}$ . Then,

$$E[X] = \sum_n (n\delta)Pr[X = n\delta] = \sum_n (n\delta)f_X(n\delta)\delta = \int_{-\infty}^{\infty} xf_X(x)dx.$$

Indeed, for any  $g$ , one has  $\int g(x)dx \approx \sum_n g(n\delta)\delta$ . Choose  $g(x) = xf_X(x)$ .

## Examples of Expectation

1.  $X = U[0, 1]$ . Then,  $f_X(x) = 1\{0 \leq x \leq 1\}$ . Thus,

$$E[X] = \int_{-\infty}^{\infty} xf_X(x)dx = \int_0^1 x \cdot 1 dx = \left[\frac{x^2}{2}\right]_0^1 = \frac{1}{2}.$$

2.  $X =$  distance to 0 of dart shot uniformly in unit circle. Then  $f_X(x) = 2x1\{0 \leq x \leq 1\}$ . Thus,

$$E[X] = \int_{-\infty}^{\infty} xf_X(x)dx = \int_0^1 x \cdot 2x dx = \left[\frac{2x^3}{3}\right]_0^1 = \frac{2}{3}.$$

## Examples of Expectation

3.  $X = \text{Expo}(\lambda)$ . Then,  $f_X(x) = \lambda e^{-\lambda x} 1\{x \geq 0\}$ . Thus,

$$E[X] = \int_0^{\infty} x \lambda e^{-\lambda x} dx = - \int_0^{\infty} x de^{-\lambda x}.$$

Recall the **integration by parts formula**:

$$\begin{aligned} \int_a^b u(x) dv(x) &= [u(x)v(x)]_a^b - \int_a^b v(x) du(x) \\ &= u(b)v(b) - u(a)v(a) - \int_a^b v(x) du(x). \end{aligned}$$

Thus,

$$\begin{aligned} \int_0^{\infty} x de^{-\lambda x} &= [xe^{-\lambda x}]_0^{\infty} - \int_0^{\infty} e^{-\lambda x} dx \\ &= 0 - 0 + \frac{1}{\lambda} \int_0^{\infty} de^{-\lambda x} = -\frac{1}{\lambda}. \end{aligned}$$

Hence,  $E[X] = \frac{1}{\lambda}$ .

## Normal (Gaussian) Distribution.

For any  $\mu$  and  $\sigma$ , a **normal** (aka **Gaussian**) random variable  $Y$ , which we write as  $Y = \mathcal{N}(\mu, \sigma^2)$ , has pdf

$$f_Y(y) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-(y-\mu)^2/2\sigma^2}.$$

**Standard normal has  $\mu = 0$  and  $\sigma = 1$ .**

Note:  $Pr[|Y - \mu| > 1.65\sigma] = 10\%$ ;  $Pr[|Y - \mu| > 2\sigma] = 5\%$ .

## Scaling and Shifting and properties

**Theorem** Let  $X = \mathcal{N}(0, 1)$  and  $Y = \mu + \sigma X$ . Then

$$Y = \mathcal{N}(\mu, \sigma^2).$$

**Theorem** If  $Y = \mathcal{N}(\mu, \sigma^2)$ , then

$$E[Y] = \mu \text{ and } \text{var}[Y] = \sigma^2.$$

## Review: Law of Large Numbers.

**Theorem:** Set of independent identically distributed random variables,  $X_i$ ,

$$A_n = \frac{1}{n} \sum X_i \text{ "tends to the mean."}$$

Say  $X_i$  have expectation  $\mu = E(X_i)$  and variance  $\sigma^2$ .

Mean of  $A_n$  is  $\mu$ , and variance is  $\sigma^2/n$ .

Used Chebyshev.

$$Pr[|A_n - \mu| > \varepsilon] \leq \frac{\text{var}[A_n]}{\varepsilon^2} = \frac{\sigma^2}{n\varepsilon} \rightarrow 0.$$

# Central Limit Theorem

## Central Limit Theorem

Let  $X_1, X_2, \dots$  be i.i.d. with  $E[X_1] = \mu$  and  $\text{var}(X_1) = \sigma^2$ . Define

$$S_n := \frac{A_n - \mu}{\sigma/\sqrt{n}} = \frac{X_1 + \dots + X_n - n\mu}{\sigma\sqrt{n}}.$$

Then,

$$S_n \rightarrow \mathcal{N}(0, 1), \text{ as } n \rightarrow \infty.$$

That is,

$$\Pr[S_n \leq \alpha] \rightarrow \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\alpha} e^{-x^2/2} dx.$$

**Proof:** See EE126.

**Note:**

$$E(S_n) = \frac{1}{\sigma/\sqrt{n}} (E(A_n) - \mu) = 0$$

$$\text{Var}(S_n) = \frac{1}{\sigma^2/n} \text{Var}(A_n) = 1.$$

# Confidence Intervals.

Recall:  $A_n = \frac{1}{n} \sum X_i$ , for  $X_i$  identical and independent.

For  $\mu = E(X_i)$  and variance  $\sigma^2$ . Mean of  $A_n$  is  $\mu$ , and variance is  $\sigma^2/n$ .

Recall Chebyshev:  $Pr[|A_n - \mu| > \varepsilon] \leq \frac{\text{var}[A_n]}{\varepsilon^2}$

Implies to get confidence  $1 - \delta$  we need

$$\text{var}A_n \varepsilon^2 = \frac{1}{n} \frac{\sigma^2}{\varepsilon^2} \leq \delta \text{ or } n \geq \frac{\sigma^2}{\varepsilon^2} \frac{1}{\delta}$$

Central Limit Theorem:

$$Pr[|A_n - \mu| > \varepsilon] \leq C \int_{x \geq \varepsilon} e^{-\frac{x^2}{2\text{var}A}} \leq C e^{-\frac{\varepsilon^2}{2\text{var}A}}$$

for  $\varepsilon > \sqrt{\text{Var}A}$  ( $C$  is roughly  $2/\sqrt{2\pi}$ )

Implies to get confidence  $1 - C\delta$  we need

$$e^{-\frac{\varepsilon^2}{2\text{var}A}} \leq \delta \implies -\frac{n\varepsilon^2}{2\sigma^2} \leq \log \delta \implies n \geq \frac{2\sigma^2}{\varepsilon^2} \log \frac{1}{\delta}.$$

## Examples: Meeting at a Restaurant

Two friends go to a restaurant independently uniformly at random between noon and 1pm.

They agree they will wait for 10 minutes.

What is the probability they meet?

Here,  $(X, Y)$  are the times when the friends reach the restaurant.

The shaded area are the pairs where  $|X - Y| < 1/6$ , i.e., such that they meet.

The complement is the sum of two rectangles. When you put them together, they form a square with sides  $5/6$ .

$$\text{Thus, } Pr[\text{meet}] = 1 - \left(\frac{5}{6}\right)^2 = \frac{11}{36}.$$

# Breaking a Stick

You break a stick at two points chosen independently uniformly at random.

What is the probability you can make a triangle with the three pieces?

Let  $X, Y$  be the two break points along the  $[0, 1]$  stick.

A triangle if

$A < B + C, B < A + C,$  and  $C < A + B.$

If  $X < Y,$  this means

$X < 0.5, Y < X + .5, Y > 0.5.$

This is the blue triangle.

If  $X > Y,$  get red triangle, by symmetry.

Thus,  $Pr[\text{make triangle}] = 1/4.$

## Maximum of Two Exponentials

Let  $X = \text{Exp}(\lambda)$  and  $Y = \text{Exp}(\mu)$  be independent.

Define  $Z = \max\{X, Y\}$ .

Calculate  $E[Z]$ .

We compute  $f_Z$ , then integrate.

One has

$$\begin{aligned}Pr[Z < z] &= Pr[X < z, Y < z] = Pr[X < z]Pr[Y < z] \\ &= (1 - e^{-\lambda z})(1 - e^{-\mu z}) = 1 - e^{-\lambda z} - e^{-\mu z} + e^{-(\lambda+\mu)z}\end{aligned}$$

Thus,

$$f_Z(z) = \lambda e^{-\lambda z} + \mu e^{-\mu z} - (\lambda + \mu)e^{-(\lambda+\mu)z}, \forall z > 0.$$

Since,  $\int_0^\infty x \lambda e^{-\lambda x} dx = \lambda \left[ -\frac{x e^{-\lambda x}}{\lambda} - \frac{e^{-\lambda x}}{\lambda^2} \right]_0^\infty = \frac{1}{\lambda}$ .

$$E[Z] = \int_0^\infty z f_Z(z) dz = \frac{1}{\lambda} + \frac{1}{\mu} - \frac{1}{\lambda + \mu}.$$

## Minimum of $n$ i.i.d. Exponentials.

Let  $X_1, \dots, X_n$  be i.i.d.  $\text{Expo}(1)$ . Define  $Z = \min\{X_1, X_2, \dots, X_n\}$ .

What is true?

(A)  $Z$  is exponential.

(B) Parameter is  $n$ .

(C)  $\lim_{N \rightarrow \infty} (1 - n/N)^N \rightarrow e^{-n}$

(D)  $E[Z] = 1/n$ .

(C) is an argument for (A), (B) and (D).

## Maximum of $n$ i.i.d. Exponentials

Let  $X_1, \dots, X_n$  be i.i.d.  $\text{Expo}(1)$ . Define  $Z = \max\{X_1, X_2, \dots, X_n\}$ .

Calculate  $E[Z]$ .

We use a recursion. The key idea is as follows:

$$Z = \min\{X_1, \dots, X_n\} + \max Y_1, \dots, Y_{n-1}.$$

From memoryless property of the exponential.

Let then  $A_n = E[Z]$ . We see that

$$\begin{aligned} A_n &= E[\min\{X_1, \dots, X_n\}] + A_{n-1} \\ &= \frac{1}{n} + A_{n-1} \end{aligned}$$

because the minimum of  $\text{Expo}$  is  $\text{Expo}$  with the sum of the rates.

Hence,

$$E[Z] = A_n = 1 + \frac{1}{2} + \dots + \frac{1}{n} = H(n).$$

## Quantization Noise

In digital video and audio, one represents a continuous value by a finite number of bits.

This introduces an error perceived as noise: the quantization noise. What is the power of that noise?

**Model:**  $X = U[0, 1]$  is the continuous value.  $Y$  is the closest multiple of  $2^{-n}$  to  $X$ . Thus, we can represent  $Y$  with  $n$  bits. The error is  $Z := X - Y$ .

The power of the noise is  $E[Z^2]$ .

**Analysis:** We see that  $Z$  is uniform in  $[0, a = 2^{-(n+1)}]$ .

Thus,

$$E[Z^2] = \frac{a^2}{3} = \frac{1}{3}2^{-2(n+1)}.$$

The power of the signal  $X$  is  $E[X^2] = \frac{1}{3}$ .

## Quantization Noise

We saw that  $E[Z^2] = \frac{1}{3}2^{-2(n+1)}$  and  $E[X^2] = \frac{1}{3}$ .

The **signal to noise ratio** (SNR) is the power of the signal divided by the power of the noise.

Thus,

$$SNR = 2^{2(n+1)}.$$

Expressed in decibels, one has

$$SNR(dB) = 10 \log_{10}(SNR) = 20(n+1) \log_{10}(2) \approx 6(n+1).$$

For instance, if  $n = 16$ , then  $SNR(dB) \approx 112dB$ .

## Expected Squared Distance

**Problem 1:** Pick two points  $X$  and  $Y$  independently and uniformly at random in  $[0, 1]$ .

What is  $E[(X - Y)^2]$ ?

**Analysis:** One has

$$\begin{aligned}E[(X - Y)^2] &= E[X^2 + Y^2 - 2XY] \\&= \frac{1}{3} + \frac{1}{3} - 2 \frac{1}{2} \frac{1}{2} \\&= \frac{2}{3} - \frac{1}{2} = \frac{1}{6}.\end{aligned}$$

**Problem 2:** What about in a unit square?

**Analysis:** One has

$$\begin{aligned}E[\|\mathbf{X} - \mathbf{Y}\|^2] &= E[(X_1 - Y_1)^2] + E[(X_2 - Y_2)^2] \\&= 2 \times \frac{1}{6}.\end{aligned}$$

**Problem 3:** What about in  $n$  dimensions?  $\frac{n}{6}$ .

# Summary

## Continuous Probability

- ▶ Continuous RVs are similar to discrete RVs
- ▶ Think that  $X \in [x, x + \varepsilon]$  with probability  $f_X(x)\varepsilon$
- ▶ Sums become integrals, ....
- ▶ The exponential distribution is magical: memoryless.
